# Nevada 02

## **Benefits of Household Electrification**

Electrifying the U.S. economy is the foundation for how we get to a clean grid by 2035, zero emissions by 2050 and have a shot at keeping climate warming within 1.5 °C.

The household is the keystone of American infrastructure: 42 percent of our energy-related carbon emissions are the result of decisions we make around our kitchen table: what cars we drive, how we power and heat our homes, how we warm our water, cook our food, and dry our laundry. There are 121 million households in the U.S., which each have a handful of machines that run on oil, gas, or antiquated "electric resistance" technology that will need to be replaced at the end of their useful life: furnaces, baseboard heaters, stoves/ovens, water heaters, clothes dryers, and fossil-fuel vehicles.

To power their new electric replacements, like **induction cooktop stoves**, **heat pump space heaters**, **and heat pump water heaters**, we will need **upgraded breaker boxes** that increase the energy capacity of our homes. This would prepare households for the next step: electric vehicles (EVs), EV chargers, solar roofs and battery storage to power it all. Every time we miss an opportunity to replace an appliance with a clean, electric alternative, we extend the life of our fossil fuel infrastructure by the useful life of that machine — for at least a decade, and maybe two. Altogether, these electrified and solar households will become an extension of the grid, capable of generating a third of our national energy needs.

**How do we get there?** We have all the technology we need now — no moonshots required. We just need to lower upfront purchase and installation costs so that household decisions and contractor recommendations are based on benefits, not price tags.

# OTHER BENEFITS OF U.S. HOUSEHOLD ELECTRIFICATION

Monthly utility bills will be lower for at least 104.7 million out of 121 million households, in every U.S. county, as a result of more efficient heat pump space heating and water heating units.

Millions of new jobs will be created, across every zip code — jobs that cannot be automated or offshored — as electricians, plumbers, and solar installers, as well as in manufacturing, finance, and other indirect sectors.

The savings are particularly meaningful for low- and moderate-income (LMI) households. LMI households have 3x the energy burden (the portion of their income spent on home energy) as other households.

Cleaner air indoors and out; studies show children in homes with gas stoves are 42% more likely to experience asthma symptoms than children in homes with electric stoves, and outdoor air pollution from residential buildings is now responsible for ~15,500 premature deaths annually¹.

## Nevada 02 Household Savings

#### **LOWER BILLS**

99% of households in
Nevada 02 — 283 thousand
— could save \$66 million a
year on energy bills if they
were using modern, electrified
furnaces and water heaters
instead of their current
machines.

#### **LARGE SAVINGS**

The savings are biggest for the 142 thousand households in Nevada O2 across every county who are currently using electric resistance, fuel oil, or propane and would save \$337 per year on average.

	# of Furnaces	Avg. savings if electrified	# of Water Heaters	Avg. savings if electrified
Electric Resistance	46.0K	\$214 / yr	0.10M	\$231 / yr
Fuel Oil	5.4K	\$516 / yr	0	\$0 / yr
Propane	15.4K	\$420 / yr	15.4K	\$342 / yr

65% of households using natural gas would also save on annual energy bills. The number of households that would save and the average savings will continue to increase given the trajectory of heat pump technology improvements.

### **EVERYONE BENEFITS**

Of the households that save, 41% are low- and moderateincome. Each year, they would save an average of \$249. Many would save up to \$324 per year on average.

Low- and moderate-income households are those making up to 80% of local area median income

## 41% of households that save in Nevada 02 are LMI

## **Nevada 02** Additional Benefits

#### **REDUCE EMISSIONS**

Furnaces, water heaters, dryers, and stoves account for at least 95% of residential building emissions but are replaced just once every 10-25 years. Unless we choose modern, electrified replacements for these machines, we will continue to need dirty infrastructure to power our homes, never getting to zero emissions.

## 500 Clean Grid without Residential Electrification 400 Clean Grid with Residential 300 Electrification 200 100 0 2025 2030 2035 2040 2045

National Residential Emissions (MMT)

## Electricians, plumbers, Installation contractors... Factory, assembly line, and Manufacturing supply chain workers... Truck drivers, welders, mine Indirect engineers, accountants... Service, retail, food & beverage

### **CREATE JOBS**

Electrification would create 540 installation jobs in Nevada 02. Nationwide, it would further generate 230,760 additional installation jobs, **80,000 manufacturing jobs** that Nevada 02 can compete for, and 800,000 indirect and induced **jobs**, including in Nevada 02.

## **IMPROVE HEALTH**

Electrifying these appliances would address the 42% increased risk of children experiencing asthma symptoms associated with gas stove use. Such indoor pollution disproportionately affects low-income households with smaller homes.

Furthermore, outdoor air pollution from residential buildings currently accounts for 31 premature deaths in Nevada 02 (state-wide) per year1.
